

Together on the way to a sustainable university

The current political situation poses major challenges for universities:
How can we save electricity together?

With 1 kilowatt hour, 50 hours can be worked on a laptop or 5 hours on a desktop PC.

Save electricity - every kilowatt hour counts!

LIGHT

- as often as possible: use daylight (also in the dark season)
- lunch break / end of work: light off
- corridors, toilets, tea kitchens: If not controlled by motion detector - please switch off manually

TEA KITCHEN

Dishwasher:

- Only on when full
- Choose ECO programme.

Heat only the amount of water needed in the kettle.

Place fridge in a shady place

Adjust the fridge temperature to 7°C

Switch off empty and unused fridges. Use thermos flasks: Protects the aroma and saves electricity.

Heat food in the microwave instead of using the cooker.

When buying new kitchen appliances, look for a good energy efficiency class.

ELECTRONIC DEVICES

- No screen savers
- When the computer is NOT in use: Stand-by mode
- Long breaks / overnight / outside operating hours: Switch off devices and computers

Electric heaters and charging of e-bike batteries are generally not permitted.

PRINTERS

- TOP: use central network printers and multifunctional devices
- FLOP: use individual devices at the workplace

print only when necessary, preferably send documents digitally

recycle paper for printing (saves water and electricity in production)

Stairs rather than lifts:

- keeps fit
- saves electricity

Thank you for your contribution to making the university environmentally friendly.
